

Harleyville, South Carolina

LOCATION & CAPABILITIES

Located 50 miles northwest of Charleston, South Carolina just off Interstate-26, SysTech's Harleyville facility processes non-hazardous, alternate solid fuel (ASF) materials, including paper, carpet, rubber strips, textiles, and plastics. These materials are then used as alternate fuel to manufacture cement on site. This facility also accepts on-spec used oil and biofuel. Additionally, it accepts whole automotive tires (no shredded tires). Harleyville also accepts iron, silica, and alumina wastes, which are non-hazardous raw materials incorporated safely and securely into cement as raw material substitutes.

Care needs to be taken to provide as clean of a stream as possible. Therefore, all ASF materials must come in dry and free of metal and food waste.

OVERVIEW
